

INF 510

Homework 7 (60 points)

Due Tuesday, April 30th at 11:59pm (via blackboard)

AKA "Project" Milestone #3

Now that we've acquired our data, and built a structure to store/manipulate it, we're going to draw some conclusions!

For this assignment, you're to submit a zip file with all the code you used, as well as a README text file that documents:

1. How to run your code (what command-line switches they are, what happens when you invoke the code, etc.)
2. Any major "gotchas" to the code (i.e. things that don't work, go slowly, could be improved, etc.)
3. Anything else you feel is relevant to your project.

Again, call this file README and put it in the root of your archive.

Next, answer the following questions:

1. What did you set out to study? (i.e. what was the point of your project? This should be close to your HW4 assignment, but if you switched gears or changed things, note it here.)
2. What did you discover/what were your conclusions (i.e. what were your findings? Were your original assumptions confirmed, etc.?)
3. What difficulties did you have in completing the project?
4. What skills did you wish you had while you were doing the project?
5. What would you do "next" to expand or augment the project?

Turn in a *plain text* file named LASTNAME_FIRSTNAME_hw7.txt (NO DOC, PDF, OR ANYTHING ELSE), that answers these questions, in the root of your zip file as well.

The rubric for HW7 is as follows:

- Python Code
 - Code is modular and robust: /20
 - Does not display a result: -5
 - No remote and/or local source command line parameter: -5
 - Code is poorly documented: -5
 - Runtime error: -5
- README:

- No instructions on how to run code or README entirely is missing: -20
- Questions
 - Question 1: /10
 - Question 2: /10
 - Question 3: /5
 - Question 4: /5
 - Question 5: /10
